

## 1.5.3 Set Up the HTML

Just like in previous lessons, we'll start on the outermost element for this chunk of content and work our way in. The outermost element for this section is, well, a `<section>` element.

---

### Add ID and Class

We already have a `<section>` element in place to hold the content for the trainers' information, but we need to give it an identifying `id`. This `id` will allow visitors to jump to this section by clicking its associated link in the navigation bar. This is a web design best practice; it lets users avoid having to scroll through a webpage looking for the content they need.

Think about how this type of navigation was achieved when you built out the "What We Do" and "What You Do" sections. What did you add to their respective `<section>` elements to identify them? You used the `id` attribute, of course!

Let's add an `id` attribute to this `<section>` element now. We'll call it `"your-trainers"`, which corresponds to that link in the navigation bar that we set up in Lesson 3.

In `index.html`, add the `id` attribute to the `<section>` element for the trainers' section so it looks like the following code:

```
<section id="your-trainers">
  <h2>Meet the Trainers</h2>
</section>
```

Let's check and see if this worked. Like in previous lessons, you can test any HTML or CSS you add by doing the following:

1. Save the file you made changes to.
2. Refresh the webpage.
3. Examine the area of the webpage that you changed; in this case, click the "Your Trainers" link in the top navigation.

If you were taken down the page to the "Meet the Trainers" section and the URL address in the browser changed to `/run-buddy/index.html#your-trainers`, then you're all set!

The next and last thing we want to do with the `<section>` element is give it a class name, so let's add `class="trainers"` to the tag. This way, when we start adding CSS to it, we can get to it by its class name, `"trainers"`. The result should look like this code:

```
<section id="your-trainers" class="trainers">
  <h2>Meet the Trainers</h2>
</section>
```

---

## Set Up the Section's Header

Now that we've given the whole section its `id` and `class` attributes, let's move on to the section's `<h2>` element to set it up for some proper styling.

The best part about updating this section's `<h2>` element is that we can reuse the styles we created in Lesson 4. We just need to provide the correct `class` attribute value and then all of the associated CSS styles for that class will be applied.

In the previous lesson, we created a few classes to provide different style options for our section titles. All of our section titles will get the class attribute labeled `section-title`, but we need to add another one to change the color of the bottom border to yellow (the yellow line under "Meet the Trainers"). So let's also add `primary-border` as well.

In `index.html`, add the following class attributes to this section's `<h2>`:

```
<h2 class="section-title primary-border">  
  Meet the Trainers  
</h2>
```
