

5.2.1 Introduction

The folks at Taskmaster admire how you've picked up new skills and run with them. Within a short time, you've familiarized yourself with their codebase and created task-edit functionality, as demonstrated in the following animation:

The client wants to add task status tracking, but first we need to prepare the page's layout. We'll create a responsive layout using Bootstrap's grid system, so we should expect to get our hands dirty with the Bootstrap documentation. In the process, we'll address other parts of the user interface that can also be improved using Bootstrap.

By the end of this lesson, you'll have learned how to do the following:

- Create responsive layouts using Bootstrap's grid system.
- Use the UI components Bootstrap provides us.
- Leverage Bootstrap's utility classes to avoid creating unnecessary custom CSS.
