

5.2.8 Reflection

Congratulations again on getting fully immersed in a library as thorough as Bootstrap. There are other CSS libraries like Bootstrap out there. Now that you know how to navigate the documentation for this one, you can pick up the other ones with no problem!

Let's review what we accomplished:

1. Created responsive layouts using Bootstrap's grid system.
2. Used the UI components Bootstrap provides us.
3. Leveraged Bootstrap's utility classes to avoid creating unnecessary custom CSS.

The key takeaway from learning a tool like Bootstrap is that we can always find the answers in the documentation. We just need to be patient as we read through it and come to fully understand how it can be used. The same can be said about any new technology—but Bootstrap definitely boasts one of the larger sets of documentation, as the library offers so much.

Now that we have the application's UI ready for organizing tasks by status, we can revisit jQuery to learn how to use an extension of the library called

jQuery UI. jQuery UI has built-in tools that allow us to create drag and drop functionality with ease. The client looks forward to seeing this feature added to Taskmaster Pro, so let's not keep them waiting!
