

## 5.1.9 Reflection

Working with legacy code always poses a challenge, so great job diving right in! New developers must often update an existing app on the first day. Apps tend to derive from a multitude of libraries, many of them learned on an as-needed basis. jQuery alone comes with a lot of new syntax to decipher, but the underlying concepts of DOM manipulation and event handling remain the same.

Let's review what we accomplished in this lesson:

- Learned to consult documentation when faced with new libraries.
- Used jQuery methods to manipulate the DOM.
- Used jQuery methods to attach delegated browser events to elements.
- Improved the user experience with focus and blur events.
- Practiced other applications of `this` to distinguish between clicked elements.

We'll continue to practice jQuery (and Bootstrap) in the coming lessons. The client wants to expand the app into multiple columns to support more

than just to-do statuses. We'll leverage the classes that Bootstrap provides to accomplish just that.
