

6.2.8 Reflection

Congratulations on learning a critical part of modern web development! Now, by creating HTTP requests, you can communicate with server-side APIs and get information from them for your own application. This skill will open you up to a whole new world of possibilities, especially when you build your own server-side APIs to communicate with!

In this lesson, you learned how to do the following:

- Capture user input from the browser to create dynamic HTTP requests
- Use an HTTP request's response to display data to a user
- Handle errors that may occur when working with server-side APIs

We should practice these vital web development skills a little more. We'll do just that when we use the GitHub API to request issue data for a single repository!
