

5.4.3 Create a Git Branch

Let's review the GitHub issue pertaining to this feature one more time, then create the feature branch. See the following image for the issue:

Let's call the feature branch `feature/dates`. We'll use `git branch` to ensure we're in the `develop` branch, as we want to build on that branch's code.

Now create a new branch for this feature:

```
git checkout -b feature/dates
```

This command creates the branch and moves us into it, but we can use `git branch` one more time just to double-check.

Now that we're in a new branch, let's get started!
