

5.1.8 Save Your Progress with Git

We've finished the work on this GitHub issue, so let's revisit the Git branch workflow:

1. Verify that the correct files were modified with `git status`.
2. Stage and commit your changes with `git add` and `git commit`.
3. Push the branch to GitHub with `git push origin feature/edit-tasks`.
4. Switch branches with `git checkout develop`.
5. Merge the new feature into the develop branch with `git merge feature/edit-tasks`.
6. Push the updated `develop` branch to GitHub with `git push origin develop`.

Finally, close the corresponding GitHub issue!
