

## 4.5.3 Create a New Git Branch

Let's review the GitHub issue pertaining to this feature one more time, then create the feature branch. Here's the issue we're working on:

Because the issue is about persistence, let's call the feature branch `feature/task-persistence`. We'll create it now from the command line:

1. Use `git branch` to ensure we're in the `develop` branch, as we want to build on that branch's code.
2. Create a new branch for this feature with the following command:

```
git checkout -b feature/task-persistence
```

As we know, this command creates the branch and moves us into it, but we can use `git branch` one more time just to double-check.

Now that we've confirmed that we're in the correct branch, let's get started!
