

4.2.1 Introduction

Taskinator is really starting to take shape! We've not only set up the HTML but have also added interactivity with the HTML elements to create new tasks for the task list, as the following image shows:

It's a great start, but we haven't managed to add new tasks to a task list just yet. What good is an app that keeps adding the same preset content? Now we'll add functionality that will allow us to create custom tasks by filling out an HTML form.

In the last lesson, we used browser events to dynamically create new HTML content and append it to the page. We'll add to that in this lesson, reading data entered into HTML form elements and using that data to create new tasks.
