

2.4.3 Set Up a New Feature

First we'll create a new feature branch for the GitHub issue "Pricing table using Grid." We'll name it in a way that relates to the GitHub issue: `feature/grid`. Before we do this, we should use `git branch` to verify that the active branch is `develop`. Then, we'll checkout into a newly created branch by using the `git checkout -b "<branch-name>"` command.

Here's what this looks like in the command line:

```
git branch
git checkout -b "feature/grid"
```

HIDE PRO TIP

Always checkout into the stable development version (in our case, the `develop` branch) before creating a new feature branch. Branching off of a different branch could insert broken or untested code, which could lead to unintended consequences.
