

2.4.12 Merge the Feature Branch

Let's follow our Git workflow and add, commit, and push our work to the remote feature branch:

```
git add .  
git commit -m "added service table comparison"  
git push origin feature/grid
```

Now let's check out into the `develop` branch, pull down any new changes, merge the new feature branch locally, then push up the updated `develop` branch into the remote repo:

```
git checkout develop  
git merge feature/grid  
git push origin develop
```

Great job. Now the rest of the team can see, test, and verify the finished feature.

Remember to close the GitHub issue, too! Before we move on to the next GitHub issue, let's take a moment for a quick knowledge check:
