

## 6.1.7 Reflection

Great job working through the ups and downs of your first server-side API! This lesson covered some pretty dense topics. In particular, you accomplished the following:

- Learned that a server-side API is an interface for accessing another website's data.
- Familiarized yourself with how to read server-side API documentation and why they often give examples using `curl`.
- Made requests to a server-side API with the browser's Fetch API.
- Used the DevTools Network tab to glean additional information about requests being made.

Now that you have access to the repository data, the next lesson will walk you through combining it with DOM methods to display this information on the UI.
