

2.4.13 Reflection

Great job on making it through a challenging lesson! Knowing how to create a modern website layout will make you stand out among other candidates when applying for developer jobs.

In this lesson, we learned how to do the following:

- Declare a grid and define its rows and columns to create customizable layouts. This is a game-changing concept that makes advanced layout design responsive to mobile devices.
- Check the adoption rate of front-end technologies on different browsers.
- Customize a grid's dimensions, positioning, and alignment, saving us time—which we can use to innovate!
- How to use CSS Grid to accommodate changing screen sizes, especially when the shape of the table needs to be altered in a media query. This level of flexibility and customization is a testament to the importance that CSS will continue to hold in the future of web development and website design.

As you advance through this boot camp, remember that you're building a foundational practice of learning that you will build on for your entire career. Employers are looking for developers who not only know the basics of CSS and HTML but also understand how to learn new technologies and advanced tools. Try to view each step, each lesson, and each module as an investment in mastering the art of learning!

In the next lesson, we'll learn some advanced CSS styling properties that will make the Run Buddy website more professional and easier to use.
