

5.3.8 Save Your Progress with Git

Our work on this GitHub issue is done, which means it's time to revisit the Git branch workflow:

1. Use `git status` to verify that the correct files were modified.
2. Use `git add` and `git commit` to stage and commit your changes.
3. Use `git push origin feature/drag-drop` to push the branch to GitHub.
4. Use `git checkout develop` to switch branches.
5. Use `git merge feature/drag-drop` to merge the new feature into the develop branch.
6. Use `git push origin develop` to push the updated `develop` branch to GitHub.

Finally, close the corresponding GitHub issue!
