

1.1.9 Reflection

This lesson mostly focused on setting up the foundational Run Buddy files and folders, Git workflow, and GitHub repo.

Even though it might not look like much yet, you've done a lot to set things up correctly, making life much easier for your future self! The HTML structure is in place and ready to be filled in with more detailed content and styling. You've established a good workflow with Git to continually save your code changes locally and on GitHub. You also have a live website on GitHub Pages that will begin to take shape as you complete the next several lessons.

Some of the major takeaways from this lesson were:

- Creating files and folders by using the `touch` and `mkdir` commands.
- Moving in and out of folders by using `cd` and `cd ..`
- Setting up the HTML structure with `<html>`, `<head>`, and `<body>`.
- Organizing content with `<div>`, `<section>`, `<header>`, and `<footer>`.
- Staging with Git by using the `git add` command.

- Making commits with `git commit -m ""` and sending them to GitHub with `git push origin master`.

Next up, we'll continue to learn more about HTML while applying a much-needed visual makeover to our elements. By the end of the module, you'll have everything you need to make beautiful websites beyond Run Buddy.

But let's finish this landing page first!
