

2.2.3 Create a Feature Branch

The GitHub issue we're working on is called "Advanced layouts using flexbox." It requires making changes to every section of the website, so it warrants creating another feature branch. Let's name it based on the feature we're implementing: `feature/flexbox`.

Follow the steps you learned in the previous lesson for creating a new feature branch:

1. Use the `git branch` command to verify that you're in the `develop` branch. If not, use `git checkout develop` to switch into that branch.
2. Use the command `git checkout -b feature/flexbox` to create and switch to the new branch.
3. Run `git branch` again to see which branch is active. If it returns `feature/flexbox`, then it worked!

If you need a refresher about how to create a feature branch, refer back to the previous lesson.
