

2.4.2 Preview

Let's take a look at the mock-up for the service plan table:

Our Service Plans		
Cancel At Any Time!	Basic	Premium
	Support Offered Between 9-5	24/7 Plan Support
	Bi-Weekly Trainer Calls	Weekly Trainer Calls
	N/A	Discounts At Select Running Stores
	Subscription to Run Buddy's Health Magazine!	
	\$10/mo	\$25/mo

We can approach this solution in a few ways. One is to use the HTML `<table>` element, but that's intended for tabular data and not the customized table design we need.

DEEP DIVE ▼

We could also use flexbox, but this could be tricky because we need a two-dimensional table with an element that spans multiple columns (for the magazine subscription row).

This leads us to a CSS layout model called **CSS Grid Layout**. CSS Grid—a two-dimensional model similar to flexbox—is nothing short of a revolutionary system for page layouts, and this is what we'll use.

Because CSS Grid comes with a steep learning curve, we'll factor in some research and experimentation into our game plan:

1. Create a new feature branch
2. Compare CSS Grid to flexbox
3. Verify that we can use CSS Grid
4. Set up a sample grid
5. Review how to use grid lines
6. Test how to position grid items
7. Use alignment to position grid content
8. Implement a new grid to match the mock-up
9. Make the grid mobile responsive
10. Merge the feature branch

The best way to learn is by doing, so let's start coding!
