1.6.8   Reflection

Modern websites demand interesting ways to deliver content. The skills you learned today will allow you to deliver that in your career as a web developer. You continued to build on your skills by tackling more advanced HTML elements, including building an interactive map and implementing a two-column layout. Nice job!

Let's recap some of the highlights from this lesson:

- You gained more experience with the webpage build process, starting with the HTML and then adding style.

- You reused CSS rules by applying CSS class selectors to achieve an efficient and clean codebase without repeating code.

- You created a two-column layout by creating container elements to a set width and declaring the `display: inline-block;`.

- You implemented a unique HTML element called an `<iframe>`, which allows nested browser content from another HTML page to be embedded into the current one. This offers user interactivity and interoperability with another website, and adds rich visual features without needing to write a lot of code.

In the next lesson, you'll get a chance to add a page to the site when you create Run Buddy's Privacy Policy page.
