# 4.2.3   Create a New Git Branch

Now's a good time to review the GitHub issue pertaining to this feature. Then we'll create the feature branch. To avoid bouncing back and forth from GitHub, let's refer to this image of the issue:

Because the issue pertains to submitting form data, let's call the feature branch `feature/form-submit`. We'll create it now from the command line.

First, we'll use `git branch` to ensure that we're in the `develop` branch, as we want to build on that branch's code. Then we'll create a new branch for this feature:

```
git checkout -b feature/form-submit
```

As we know, this creates the branch and moves us into it, but we can use `git branch` one more time just to double-check.

Now that we've confirmed we're in the correct branch, let's get started!
