# 5.4.2   Preview

See the following two images for mock-ups of the client's feature requests:

This first mock-up shows that the client wants to add a date picker. The date picker will help users easily select a due date and will prevent potential user errors by enforcing a date entry format. We'll use jQuery UI to implement this feature.

The second mock-up shows each task highlighted as its due date approaches. Using native JavaScript for this purpose could be a little awkward; instead, we'll use a JavaScript library called Moment.js to audit the date a user picks and warn them if that date is drawing near. These two enhancements will really enhance the application's functionality.

Because we're familiar with jQuery UI's documentation, we'll start with that and then introduce native JavaScript date and time concepts, along with Moment.js.

Try your hand at ordering the steps that we'll take to do all this:
