6.3.7   Reflection

Congratulations on using your skills of API fetching and DOM manipulation to create a brand-new page!

You also accomplished the following:

- Learned that request and response headers contain additional information about the request, separate from the data itself—like GitHub's `Link` header that lets you know there are more pages of results to request.

- Leveraged a new GitHub API endpoint to request more specific data, using an optional `?` string to change how results are sorted.

Remember, right now the `single-repo.html` page works, but it depends completely on some hardcoded values at the bottom of `single.js`. Next, we'll hook it up to the homepage so that users can see detailed info on any repo they click on.
