1.2.10 **Reflection**

We covered a lot in this lesson. There's no easy way to be introduced to some of these concepts—CSS in particular—so we just jumped right in and started coding. To recap what we did:

- We built two major components that typically go on every webpage: the header and footer. By doing them one by one, we were able to learn about new HTML elements and structure without getting overwhelmed.

- We introduced quite a few new HTML elements that we will use throughout the rest of this project (and our careers!).

- We learned about HTML attributes, which provide more context, meaning, and functionality to HTML elements.

- We became familiar with CSS: what it does, what it looks like, and how to implement it using the `link` element and relative paths.

- We used CSS element selectors and properties to style elements and nested elements.

- We learned how to use CSS to override the default way that browsers style HTML elements.

The best part about hitting all of these new topics at once is that the upcoming steps will be less introduction and more doing! The basic concepts you learned in this lesson will carry through your entire career as a developer.

In the next lesson, we'll move on to the body of the landing page, starting with creating a flashy "hero" section to entice visitors to stay on our site and eventually sign up with Run Buddy.
