1.5.7 **Reflection**

You're almost there! There are two more important pieces left to build, but at this point you've learned so much about various HTML and CSS properties that they shouldn't feel too heavy.

Let's recap what we did in this lesson:

- We learned how to fix some bugs created by float-based layouts by implementing **block element context** to the parents of floated elements.

- We created **utility classes** that can be applied to control the text alignment of any element on the page.

- We implemented the `<article>` tag to help encapsulate related content on the page, allowing the browser and screen readers to have an easier time reading our content.

- Lastly, we used a lot of what we'd learned previously in this project and reinforced our knowledge of both HTML and CSS.

The next lesson will introduce us to a couple of new HTML tags as we build the "Reach Out" section of the Run Buddy landing page. Onwards!
